Appl. No. 09/899,552
Response dated June 13, 2006
Reply to Office Action of March 13, 2006

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1.-2.   (Cancelled Herein)

3.   (Currently Amended) ~~The~~ A method of ranking the immune response of a test animal within a population of animals under stress ~~according to claim 2 further,~~ comprising

        (a) immunizing the animals with at least one antigen at least once before the onset of the stress and at least once during the stress; and

        (b) measuring the antibody response of the animals to the at least one antigen at least once before the onset of the stress and at least twice during the stress,

wherein the changes in antibody responses between each measurement are added to provide a total antibody response and a total antibody response for the test animal that is greater than an average total antibody response for the population indicates that the animal is a high immune responder and negative changes in antibody responses during the stress are given greater weight than changes in antibody response at other times.

4.   (Cancelled Herein)

5.   (Currently Amended) The method according to claim 3[[4]], wherein negative changes in antibody responses during the stress are multiplied with a co-efficient of about 1.5.

6.   (Original) The method according to claim 3, wherein the stress is selected from the group consisting of disease, weaning, castration, dehorning, branding, shipping, change in ration, social disruption, restraint, periparturition and exercise.

2

7.   (Original) The method according to claim 6, wherein the stress is periparturition.

8.   (Currently Amended) The method according to claim 3~~1~~, wherein the animal is bovine.

9.   (Original) The method according to claim 8, wherein the bovine is selected from a multiparous cow and a primiparous cow.

10.   (Original) The method according to claim 8, wherein the bovine is a multiparous cow.

11.   (Currently Amended) The method according to claim 3~~1~~, wherein the antigen is selected from the group consisting of hen egg white lysozyme, human serum albumin, tyrosine-glutamine-alanine-lysine [SEQ ID NO::1] copolymer and ovalbumin.

12.   (Original) The method according to claim 11, wherein the antigen is ovalbumin.

13.   (Original) The method according to claim 12, wherein the antigen is formualted with an adjuvant selected from the group consisting of Freunds complete adjuvant (FCA), non-ulcerative Freunds adjuvant (NUFA), complete NUFA and *mycobacteria* cell wall extract.

14.   (Currently Amended) The method according to claim 3~~1~~, wherein the antigen is formulated into a vaccine.

15.   (Original) The method according to claim 14, wherein the vaccine is *Escherichia coli* J5.

3

16.   (Currently Amended) The method according to claim 3~~1~~, wherein a source for measuring the antibody response is selected from the group consisting of blood and milk.

17.   (Original) The method according to claim 7, wherein the measuring of the antibody response at least once before the onset of the stress is at about 8 weeks before parturition and the measuring of the antibody response at least once during the stress is at about 3 weeks before parturition and at about parturition.

18.   (Original) The method according to claim 7, wherein the measuring of the antibody response at least once before the onset of the stress is at about 8 weeks before parturition and the measuring of the antibody response at least once during the stress is at about 3 weeks before parturition, at about parturition and at about 3 weeks after parturition.

19.   (Original) The method according to claim 7, wherein the immunizing the animals at least once before the onset of the stress is at about 8 weeks before parturition and the immunizing the animals at least once during the stress is at about 3 weeks before parturition and at about parturition.

20.   (Original) The method according to claim 7, wherein the immunizing the animals at least once before the onset of the stress is at about 8 weeks before parturition and the immunizing the animals at least once during the stress is at about 3 weeks before parturition, at about parturition and at about 3 weeks after parturition.

21.   (Currently Amended) ~~The~~ A method of ranking the immune response of a test animal within a population of animals under stress ~~according to claim 1 further,~~ comprising:

        (a) immunizing the animals with at least one antigen at least once before the onset of the stress:

4

___(b) measuring the antibody response of the animals to the at least one antigen at least once before the onset of the stress and at least once during the stress; and

(c) calculating a mathematical index of the antibody response, wherein the mathematical index is: y = primary antibody response, wherein

(i) y is the immune response; and

(ii) the primary response is the difference in antibody quantity at a first time point before the onset of stress and a second time point during the stress, wherein the animal is immunized at the first time point before the onset of stress;

wherein a test animal having a y value greater than about one standard deviation above the average of the y value for the population is a high immune responder.

22. (Currently Amended) ~~The~~A method of ranking the immune response of a test animal within a population of animals under stress ~~according to claim 3, further~~ comprising:

___(a) immunizing the animals with at least one antigen at least once before the onset of the stress and at least once during the stress;

___(b) measuring the antibody response of the animals to the at least one antigen at least once before the onset of the stress and at least two times during the stress; and

(c) calculating a mathematical index of the antibody response, wherein the mathematical index is: y = primary antibody response + secondary antibody response, wherein

(i) y is the immune response;

(ii) the primary response is the difference in antibody quantity at a first time point before the onset of stress and a second time point during the stress, wherein the animal is immunized at the first time point before the onset of stress; and

(iii) the secondary response is the difference in antibody quantity at a second time point during the stress and at a third time point during the

5

stress, wherein the animal is immunized at the second time point during the stress;

wherein with animals exhibiting a negative secondary response, the secondary response is <u>given greater weight than the primary response</u> ~~weighted with a co-efficient greater than 1~~, and a test animal having a y value greater than about one standard deviation above the average of the y value for the population is a high immune responder.

23.   (Currently Amended) A method of ranking the immune response of a test animal within a population of animals under stress comprising:

(a) immunizing the animals with at least one antigen at least once before the onset of the stress and at least twice during the stress;

(b) measuring the antibody response of the animals to the at least one antigen at least once before the onset of the stress and at least three times during the stress; and

(c) calculating a mathematical index of the antibody response, wherein the mathematical index is: y = primary antibody response + secondary antibody response + tertiary antibody response, wherein

(i) y is the immune response;

(ii) the primary response is the difference in antibody quantity at a first time point before the onset of stress and a second time point during the stress, wherein the animal is immunized at the first time point before the onset of stress;

(iii) the secondary response is the difference in antibody quantity at a second time point during the stress and at a third time point during the stress, wherein the animal is immunized at the second time point during the stress; and

(iv) the tertiary response is the difference in antibody quantity at a third time point during the stress and at a fourth time point during the stress, wherein the animal is immunized at the third time point during the stress;

6

wherein with animals exhibiting negative secondary and/or tertiary antibody responses, the secondary and/or tertiary antibody responses are <u>given greater weight than the primary response</u> ~~weighted with a co-efficient greater than 1~~, and a test animal having a y value greater than about one standard deviation above the average of the y value for the population is a high immune responder.

24.   (Currently Amended) A method of ranking the immune response of a test animal within a population of animals under stress comprising:

(a) immunizing the animals with at least one antigen at least once before the onset of the stress and at least twice during the stress;

(b) measuring the antibody response of the animals to the at least one antigen at least once before the onset of the stress and at least four times during the stress; and

(c) calculating a mathematical index of the antibody response, wherein the mathematical index is: y = primary antibody response + secondary antibody response + tertiary antibody response + quaternary antibody response, wherein

(i) y is the immune response;

(ii) the primary response is the difference in antibody quantity at a first time point before the onset of stress and a second time point during the stress, wherein the animal is immunized at the first time point before the onset of stress;

(iii) the secondary response is the difference in antibody quantity at a second time point during the stress and at a third time point during the stress, wherein the animal is immunized at the second time point during the stress;

(iv) the tertiary response is the difference in antibody quantity at a third time point during the stress and at a fourth time point during the stress, wherein the animal is immunized at the third time point during the stress; and

7

(v) the quaternary response is the difference in antibody quantity at a fourth time point during the stress and at a fifth time point after the stress;

wherein with animals exhibiting negative secondary and/or tertiary antibody responses the secondary and/or tertiary antibody responses are given greater weight than the primary or quaternary response weighted with a co-efficient greater than 1, and a test animal having a y value greater than about one standard deviation above the average of the y value for the population is a high immune responder.
